

Core Modules

Omnis Integrated Security Software

What are the Core Modules?

The Core Modules provide the core functionality required of all business critical systems - User Management, Event Management, Evidence Generation and Audit Trails. The benefit of a fully integrated system means that these essential functions are managed centrally providing better control and visibility of the systems and helps ensure adherence to procedures.

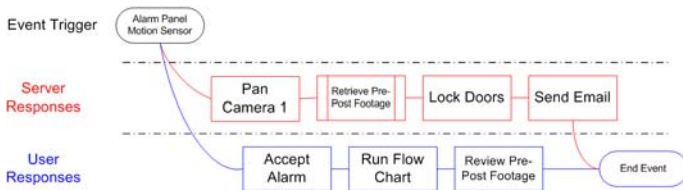

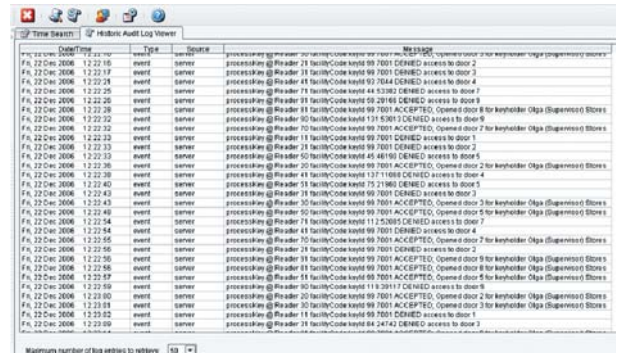

User Management

- Floating User Licences (which limit the number of users logged in simultaneously) mean that fewer licences need be purchased.
- Assign Access Rights individually or define User Groups to assign the same access rights to specific groups.
- Assign Access Rights per device, per module or per user-defined area.

Audit Log

- Tracks every user access and action.
- All system level triggers, alarms and events are logged.
- Data can be filtered and user-tailored reports generated for review and for addition to Evidence Folders if required.

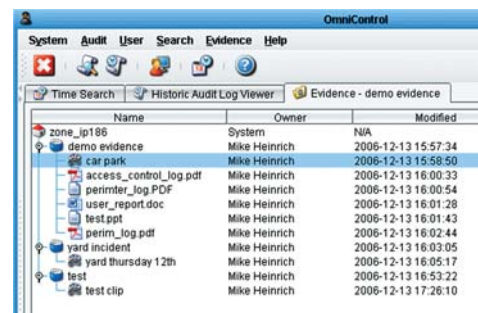

Event & Alarm Management

- Provides an extremely powerful, user-configured Event & Alarm Management system, uniquely configured to users' specific and individual needs.
- Any event generated by any device or any module is sent to the unique Omnis Event Management system.
- Any other device or module can be configured by the user to respond to specific events or event types.

Evidence Management

- A simple Wizard guides users through the Evidence Generation Process.
- Incorporate evidence from any Omnis system module, including Video Clips, Data & Reports.
- Incorporate evidence from third party sources.
- Export encrypted evidence for burning to a CD that requires no specialist software for viewing by authorised individuals.
