

# Omnis

## Integrating Business and Security

### Omnis Overview

Salent's Omnis Integrated Security Management Software provides a powerful, high-performance command and control system. The software allows users to manage day-to-day security matters, providing complete visibility and control of your operations. Modules within Salent's Integrated Security Management Software can be installed in isolation or in any combination, allowing a system to be tailored to individual user requirements.

The system can run operate as a simple client-server, or scale to a fully redundant, enterprise system. The Omnis system is built on the principle of Open Standards and fully embraces web services, all of which helps you gain visibility and control of your operations.

### Omnis Modular Software

Omnis is a framework of software modules consisting of three principle elements. This flexible approach means that you get exactly the system you want :-

- **Core Modules**

The Core Modules provide the essential functionality required of all business critical systems such as User Management, Event Management, Evidence Generation and Audit Trails.

- **Device Modules**

The Device Modules provide the interfaces to control and configure third party devices and systems. The Device Modules can be mixed and matched to provide the precise solution you need. The Device Modules plug into the core modules to provide a tightly integrated Management, Command and Control System.

- **Business Modules**

This is where a well engineered and modular design really allows you to realise the full benefit of your security and other systems. The Business Modules are designed to resolve industry-specific problems. They process, analyse and report on the underlying data generated by the core and device modules. They are designed to help you improve operating efficiency and increase profitability.
